Exercise 1.

Build at las with 2 charts over the n-dimensional sphere $\mathbb{S}^n := \{x \in \mathbb{R}^{n+1} : ||x|| = 1\}.$

Solution. Let ϵ_i be the *i*-th unitary vector from the standard basis, and let $R := \epsilon_{n+1}, -R =$ $-\epsilon_{n+1}$ be the "north" and "south" poles of the sphere.

The atlas with two charts that we are going to build is the following. Let $U_+ := \mathbb{S}^n \setminus \{R\}$ and $U_- := \mathbb{S}^n \setminus \{-R\}$,

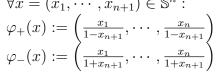

$$\mathcal{A} = \{ (U_+, \ \varphi_+ : U_+ \mapsto \mathbb{R}^n), \ (U_-, \ \varphi_- : U_- \mapsto \mathbb{R}^n) \}$$

Where φ_+, φ_- are the stereographic projections of the sphere with respect to the poles R, -R:

$$\forall x = (x_1, \dots, x_{n+1}) \in \mathbb{S}^n :$$

$$\varphi_+(x) := \left(\frac{x_1}{1 - x_{n+1}}, \dots, \frac{x_n}{1 - x_{n+1}}\right)$$

$$\varphi_-(x) := \left(\frac{x_1}{1 + x_{n+1}}, \dots, \frac{x_n}{1 + x_{n+1}}\right)$$

Note that $\forall x \in \mathbb{S}^n$

$$\varphi_{-}(x) = (\varphi_{+} \circ [\epsilon_{1} \cdots \epsilon_{n} - \epsilon_{n+1}])(x)$$

So we only need to prove that φ_+ is a homeomorphism.

$$\varphi_+^{-1}(y) = \left(\frac{2y_1}{\|y\|^2 + 1}, \cdots, \frac{2y_n}{\|y\|^2 + 1}, \frac{\|y\|^2 - 1}{\|y\|^2 + 1}\right)$$

Note that

$$\|\varphi_{+}^{-1}(y)\|^{2} = \frac{1}{(\|y\|^{2}+1)^{2}} \left[(\|y\|^{2}-1)^{2} + \sum_{i=1}^{n} 4y_{i}^{2} \right]$$

$$= \frac{1}{\|y\|^{4}+2\|y\|^{2}+1} \left[\|y\|^{4}-2\|y\|^{2}+1+4\|y\|^{2} \right]$$

$$= \frac{1}{\|y\|^{4}+2\|y\|^{2}+1} (\|y\|^{4}+2\|y\|^{2}+1)$$

$$= 1$$
